

Memory Game

This project is a browser-based Memory Card Matching Game, where users match pairs of cards within the least number of moves and time.

The base project was cloned from an existing repository, and enhancements were implemented using **GitHub Copilot in VS Code**.

Key Learnings -

1. Understanding and analyzing an existing codebase
2. Enhancing user experience by adding Dark/Light mode toggle
3. Using AI tools effectively for development and code modification
4. Learning prompt-based development workflow

Building Process -

1. Repository Setup

- Cloned the base project from GitHub
- Opened the project in VS Code workspace

Prompt - “ Git Clone <https://github.com/arunnandewal-happyvibes/memory-game-GHCP.git> in a new workspace “

2. Code Understanding

Used GitHub Copilot to understand the existing HTML structure and game logic.

Prompt - “ Explain to me what exactly this code does “ - Ask mode

This helped in:

- Understanding game mechanics
- Identifying where UI changes can be implemented

3. Feature Enhancement – Dark Mode

Goal: Improve user experience by adding theme customization.

Prompt 1 - “ Can I add a night mode or dark mode to this game “ - Ask mode

Prompt 2 - “ Make the changes to the file and save it “ - Agent mode

Outcome:

- Added Dark/Light mode toggle button
- Updated CSS styles dynamically

4. Deployment

Prompt -

“ Push this to below repo - https://github.com/GPrerna09/memory_game_dark_theme.git “

Outcome -

Use the below Link to run the Game Link in browser:

Link - <https://htmlpreview.github.io/>

Game Link -

https://github.com/GPrerna09/memory_game_dark_theme/blob/19e18d295b546114298f9ddb6e023acdc7344634/memory-game.html

Memory Game

Match all the pairs to win! Use keyboard or mouse to play
